DIY TERRARIUM KIT CARE GUIDE

Your DIY terrarium kit makes an open terrarium, built by you. It doesn't need fuss. Give it the right spot, water it to suit the plants you chose, and let it settle in over time.

Light
Place it in bright, indirect light. Harsh direct sun through the glass can stress the plants and dry out the soil too quickly.

Watering
How you water depends on what you planted. If you've planted succulents or cacti, follow the ***Succulent and Cacti Terrarium Care Guide***. Succulents like to dry out between waterings. If you've planted tropical plants, keep the soil moist but not wet. Your bowl has a drainage layer rather than drainage holes, so add water slowly and a little at a time, at the base of the plants.

Building a closed terrarium instead
Your kit comes as an open terrarium, but if you'd like a closed one, all you need is a clear lid. Choose humidity-loving tropical plants, add the lid, and you have a closed terrarium. From there, follow the ***Closed Terrarium Care Guide*** for light, watering and airflow. Succulents and cacti aren't suited to closed terrariums, so keep those open.

General care
Keep an eye on growth and remove any dead leaves as you see them. Plants adapt and settle into their surroundings over time, so a light touch is best.

A few things to remember
Choose plants that suit the way you're building. Adjust your watering to the plants you've chosen. And if you've planted succulents or cacti, follow the Succulent and Cacti guide.
